

PARKBNB

The operating layer for fragmented urban parking capacity.

FIND • PROTECT • SPECIALIZE • MANAGE • MONETIZE

Seed Investment Round · 2026 · Indore, MP, India

One network connecting demand, physical access, live occupancy and parking capacity.

Parking is not one problem — it is a broken ecosystem

Demand exists. Space exists. Infrastructure exists. What is missing is the digital layer connecting them.

1

Destination uncertainty

Drivers reaching markets, offices or hospitals cannot reliably verify open parking in advance.

2

Unauthorized usage

Private parking and driveway owners face squatting with little control over who parks there.

3

Large-vehicle friction

Buses, shuttles and logistics fleets need turning radius, clearance and legal waiting space.

4

Under-managed lots

Commercial lots have capacity but often rely on manual entry and passive CCTV.

5

Idle capacity

Owners lack an end-to-end tool for listing, booking, access, payment and payout.

Parkbnb turns fragmented parking capacity into a connected, bookable and controllable network.

Five everyday parking journeys. One missing certainty.

The same problem appears at offices, markets, temples, tourist destinations and transport hubs.

Common demand signal: “I am going to X — show me a trusted place to park there, for my time window.”

Parkbnb: one operating layer across the parking stack

Not another parking app — a unified layer connecting demand, physical access and spatial management.

Network effect: more supply → better discovery → more bookings → richer occupancy data → better operations.

THE SAME PLATFORM SERVES DIFFERENT PARKING ASSETS.

Different spaces need different levels of access control and intelligence — the software layer stays connected.

HOUSEHOLD / SINGLE BAY	List idle hours	Smart lock / ParkoBot-type controller	Owner payout
PRIVATE PLOT / SMALL LOT	List multiple spaces	Barrier + QR / BLE	Bookings + occupancy
MALL / OFFICE / SOCIETY	Manage existing capacity	Existing barrier + ANPR	CCTV + analytics
BUS / FLEET PARKING	Reserve large space	Controlled entry	Time-window + vehicle verification
NEW PARKING SITE	Create capacity	Geometry optimizer	Slot layout + circulation

APP + ACCESS + AI + OPTIMIZATION = ONE CONNECTED PARKING OPERATING LAYER

From search to settlement — with physical access in the loop

DRIVER

SPACE OWNER

Space Optimizer Engine

Convert unorganized plots into maximum feasible parking capacity.

Illustrative example; final capacity depends on site geometry, access and engineering constraints.

Intelligent CCTV Vision (Edge AI)

Turn existing cameras into live occupancy signals without requiring a sensor in every bay.

The original deck's "80% cheaper" claim is intentionally removed until benchmark data is validated.

Smart barrier hardware

A private listing is only valuable when the owner can control physical access.

BLE unlock

Target < 1.5 sec

Low-power actuator

Solar / long-life battery

Weather-resistant

Steel protective casing

Economics

Target 4–6 month payback*

**Payback is a model assumption based on the unit economics shown later; validate in pilot deployments.*

Large vehicle & fleet parking infrastructure

Purpose-built capacity for vehicles that cannot use standard parking bays.

01

Corporate & school shuttles

Pre-bookable waiting bays near offices and schools.

Scheduled time slots

02

Tourist & pilgrim coaches

Dedicated large bays near shrines, monuments and event venues.

Day + overnight bays

03

Commercial logistics

Guaranteed staging bays for last-mile delivery vehicles.

ANPR + automated access

Spatial engine advantage: match turning radius, height clearance and access constraints to the right bay.

Monetize idle hours — not just real estate

Illustrative pilot assumptions: 70% owner / 30% Parkbnb split on gross booking value.

PER-BAY MODEL

$$\begin{aligned} &\text{₹40/hr} \times 4 \text{ hrs/day} \times 30 \text{ days} \\ &= \text{₹4,800 monthly GMV} \end{aligned}$$

Owner 70% → ₹3,360 / month

Parkbnb 30% → ₹1,440 / month

NETWORK SCALE (same assumptions)

100 bays

₹4.8L GMV

₹1.44L Parkbnb take

1,000 bays

₹48L GMV

₹14.4L Parkbnb take

1,500 bays

₹72L GMV

₹21.6L Parkbnb take

All figures above are scenario math, not realized revenue. Actual utilization, pricing and churn must be validated in pilots.

Hardware cost in source deck: ₹6,000–₹8,000 per unit | payback target: 4–6 months

A large and increasingly digital parking opportunity

The source deck cites third-party India smart-parking estimates; verify figures and source methodology before external circulation.

\$4.9B

2025–2031 cited forecast

300M+

Registered vehicles

India; source-deck figure

Why Parkbnb can win

Fragmented private supply + under-managed lots + access hardware + occupancy intelligence create a broader opportunity than a parking-discovery app alone.

Source cited in original deck: MobilityForesights, IMARC Group, Astute Analytica. Third-party estimates; independently validate.

Multi-layer monetization

Marketplace fees create liquidity; SaaS and hardware create recurring revenue around managed supply.

B2C	Drivers	Booking convenience fee	₹10–₹25 / booking
B2B2C	Space owners	Marketplace commission	70% owner / 30% Parkbnb
B2B	Commercial lots	CCTV Edge AI + barriers	Setup fee + monthly SaaS
B2B	Developers / plots	Space Optimizer	Design fee + setup commission
B2G	Municipalities	Digital parking networks	Long-term infrastructure contracts

Long-term model: high-margin software + marketplace take, layered on installed physical infrastructure.

Parking has marketplaces, parking hardware and parking software — but they solve different layers.

Parkbnb's opportunity is to connect the layers into one operating workflow.

Competitive framing informed by public product descriptions for JustPark, Get My Parking and parking-design platforms; capabilities should be re-validated before external circulation. [cite](#)[turn0search0](#)[turn0search8](#)

Why the system gets stronger as it scales

The moat is not one feature — it is the combination of supply, access, vision and spatial data.

Moat thesis Unifying private supply creation + physical access + live occupancy + spatial intelligence on one network.

Competitive comparisons in the original deck should be independently verified before investor distribution.

Technology validated — commercial pilot next

This slide intentionally separates what is built/tested from what still needs market validation.

Platform

Working prototype built

CCTV vision

Occupancy detection tested

Hardware

Smart-lock prototype built

Space optimizer

Layout algorithm prototype built

Customer discovery

Operator / customer discussions in progress

Commercial proof

Paid pilots / LOIs / deployment metrics — next milestone

Next validation gate

paid pilot deployments in Indore → measure utilization, detection accuracy, access reliability and repeat bookings.

Do not add LOIs, accuracy, sites or revenue here until they are real and documented.

Win dense micro-markets before expanding city-wide

The strategy is supply clustering: build enough parking density around a destination to make the network useful.

01

Months 1–6

DESTINATION NODES

Acquire 20–30 bays around anchor hubs in Indore.

Solve marketplace cold start

02

Months 6–12

PRIVATE SUPPLY

Add driveways and vacant plots with smart access.

Build dense micro-radius supply

03

Months 12–18

CONSUMER SCALE

Target corporate staff, shoppers and tourists around live nodes.

Increase repeat bookings

04

18+

B2G EXPANSION

Pursue municipal integrations after pilot economics are proven.

Scale city-wide

Principle: density first, city-wide expansion second.

Seed funding to prove the first repeatable parking clusters

₹1.5–₹2.5 Cr for an 18-month execution window.

SEED ROUND

₹1.5–₹2.5 Cr

18 months runway

USE OF FUNDS

18-MONTH VALIDATION TARGETS

- 50+ sites / 1,500 slots installed in Indore clusters
- Hardware batching + field testing
- Recurring marketplace + B2B SaaS revenue
- 1 municipal trial pursued after pilot proof

Funding objective: prove repeatable unit economics, supply density and operational reliability — then scale.

PARKBNB

Connecting fragmented parking capacity into one intelligent network.

Find. Protect. Specialize. Manage. Monetize.
